

DC Motors

- used in a variety of robotics applications
 - motion/speed
- construction → permanent magnet motor

on the rotor there is a commutator

by hand demo

demo

see slides

Good for:

Speed and torque control (at higher speeds)

But: τ_{stall} torque

stepper motors

- By energizing each phase in sequence, the motor will rotate one step at a time
- Before we talk about how it works, let's cover applications

Good For:

position control move precisely in repeatable steps (CNC)

Speed control: precise increments allow excellent control of rotation (process control/robotics)

Low speed torque: maximal torque at low speeds

Limitations

- low efficiency - movement when no work
- unless you use specific (servo) drives requires a lot of torque
- bad high speed torque
- No feedback (limit switches or home detectors)

Bipolar Stepper

2 phases - Four wires, 2 per phase

"ON = NORTH"

NAME MT-17

DATE

LESSON Motors

PAGE 2 of 2

Sequence

$A \bar{B} C \bar{D}$
 $\bar{A} \bar{B} C \bar{D}$
 $\bar{A} B C \bar{D}$
 $\bar{A} B \bar{C} \bar{D}$
 $\bar{A} B \bar{C} D$
 $\bar{A} \bar{B} \bar{C} D$
 $A \bar{B} \bar{C} D$
 $A \bar{B} \bar{C} \bar{D}$

Note: A, B never on together
C, D never on together

our motors are 1.8° per step \Rightarrow

200 steps / revolution

\Rightarrow our sequence needs $25\times$ to go 360°
 14.4° per sequence

o To improve mechanical advantage and
 get better torque, we use gears.
 we will learn a little more about
 gearing in the future.
